PROFESSIONAL SUMMARY

Android Software Engineer with 5+ years of experience designing and shipping production mobile applications in Kotlin and Jetpack Compose. Specialised in Kotlin Multiplatform (KMP) and Compose Multiplatform (CMP), multi-module Clean Architecture with MVI and MVVM, and payment-critical flows including HyperPay, 3D Secure, and OTP-verified checkout. Experienced in REST API integration, Firebase, Room/SQLite persistence, full Arabic/English RTL localisation, and AI-powered features built on Claude AI and LLM APIs. Proven record of code review, mentoring junior developers, and delivering in Agile teams.

TECHNICAL SKILLS

Programming Languages: Kotlin, Java

Android: Android SDK, Jetpack Compose, Compose Multiplatform (CMP), Kotlin Multiplatform (KMP), Material Design 3, Coroutines, Flow, Room, SQLite, Navigation Component, Paging 3, WorkManager, LiveData, Data Binding

Architecture & DI: Clean Architecture, MVI (reducers, middlewares, effects), MVVM, multi-module design with api/impl separation, Dagger, Anvil, Hilt

Backend & APIs: REST API, Retrofit, Moshi, OkHttp, JSON, Firebase (Authentication, Realtime Database, Cloud Functions, FCM, Crashlytics), Postman, Swagger

Payments & Security: HyperPay / OPPWA SDK, 3D Secure, mada, Visa/Mastercard, MisPay, saved cards, in-app wallet, OTP verification, biometric authentication, AES-encrypted payloads, token refresh

AI Integration: Claude AI, LLM APIs, recommendation engines, user behaviour analytics, machine learning APIs

Other: Embedded Unity (IL2CPP) integration, Google Maps, QR code generation, Arabic/English localisation with RTL support, dark mode

Tools & Practices: Android Studio, Git, GitHub, Bitbucket, Jira, Figma, Agile, Scrum, code review, performance optimisation

Languages: Arabic (Native), English (Professional)

PROFESSIONAL EXPERIENCE

Android Software Engineer | Technzone | Amman, Jordan | Jan 2022 - Present

- Deliver production B2B and B2C Android applications for the Jordanian and Saudi markets using Kotlin, Jetpack Compose, and Clean Architecture.
- Conduct code reviews, mentor junior developers, and lead Compose-based UI migration across the team's applications.
- Integrate Claude AI and automation tools to build intelligent workflows and smart filtering features.
- Improve app performance and user retention by optimising caching, navigation flows, and local persistence with Room and SQLite.

Ammni — Insurance Marketplace App (Android)

Kotlin, Jetpack Compose, Material 3, MVI, Dagger/Anvil, Retrofit, Moshi, HyperPay

Insurance platform for the Saudi market covering motor, travel, and medical malpractice insurance, from quote comparison through policy purchase and payment.

- Built the end-to-end motor insurance purchase flow (vehicle details → live offers from multiple insurers → comparison → checkout and payment) as a four-step Jetpack Compose wizard.
- Contributed to architecting a multi-module codebase of 30+ Gradle modules with api/impl separation, using MVI (reducers, middlewares, effects) and Dagger/Anvil dependency injection.
- Integrated HyperPay payment methods (mada, Visa/Mastercard, MisPay) with server-driven payment-method availability, OTP-verified checkout, and payment result tracking.
- Implemented live offer aggregation with parallel per-company quote fetching, shimmer loading states, price sorting and filtering, deductible selection, additional coverages, and side-by-side comparison.
- Developed secure networking with AES-encrypted API payloads and token refresh, plus identity features including OTP login, biometric authentication, IBAN verification for payouts, and vehicle ownership transfer.
- Delivered a reusable Compose component library (searchable dropdowns, OTP views, countdown timers, payment grids) and full Arabic/English localisation with RTL and runtime language switching.

Parkaway — Smart Parking Booking App (Android)

Kotlin, MVVM, Hilt, Coroutines/Flow, Retrofit, Room, Paging 3, Unity (IL2CPP), Firebase, HyperPay

Production app for finding, booking, and paying for parking spots, featuring an embedded Unity 3D engine for interactive parking-lot visualisation, in-app wallet, subscriptions, and car-wash booking.

- Developed and maintained the app in Kotlin using MVVM, Dagger Hilt, Coroutines/Flow, LiveData, Retrofit + Moshi, Room, Navigation Component, Paging 3, and WorkManager, shipped across multiple Play Store releases.
- Integrated an embedded Unity 3D (IL2CPP) module into the native app for real-time 3D visualisation of parking lots and spot selection.

- Designed a dynamic over-the-air content update system for Unity assets: versioned releases fetched from the GitHub Releases API, streamed downloads with live progress via Kotlin Flow, extraction and validation, and fallback to the previous version on failure — enabling 3D content updates without a new app release and cutting install size.
- Implemented a hybrid WebView-to-native bridge for the map flow, parsing the selected parking-lot ID from URL parameters and returning it to the native booking flow via the Activity Result API.
- Integrated online payments with the HyperPay (OPPWA) mobile SDK including 3D Secure, saved cards, in-app wallet, and subscription bundles.
- Added Firebase Cloud Messaging push notifications, Crashlytics monitoring, Google Maps integration, QR-code booking passes, dark mode, and full Arabic/English RTL localisation.

Android Software Engineer | Wajeez | Amman, Jordan | May 2021 - Dec 2021

- Revamped the company's main mobile application, improving UI consistency and performance.
- Migrated a legacy Java codebase to Kotlin, reducing the crash rate by 20%.
- Collaborated with cross-functional teams following Agile and Scrum methodologies.

PERSONAL PROJECTS

Wasta — Freelance and Connection Platform

Kotlin Multiplatform (KMP), Compose Multiplatform (CMP), MVI, Firebase

- Built a cross-platform application targeting Android and iOS from a single Kotlin codebase.
- Implemented MVI architecture with a modular design for scalability and maintainability.
- Grew the platform to 16,000+ organic users with zero paid marketing.
- Integrated AI-driven recommendations and user behaviour analytics, with Firebase for real-time data, authentication, and cloud functions.

Mashroo3i — Home Business Marketplace App (Android)

Kotlin, Android SDK, Google Maps, SMS OTP — published on Google Play

Marketplace app enabling Jordanian families to open a home store and sell home-made products such as food, sweets, and handicrafts as a source of household income.

- Built the seller side: store creation and profile management with description, governorate, map location, working hours, and multi-image product listings with pricing.
- Developed buyer-side discovery including featured stores, category browsing, nearest stores by location, and product search.
- Implemented cart and checkout with a map-based delivery location picker, order notes, order history, and direct seller contact.
- Implemented phone-based registration and login with SMS OTP verification and session management.
- Delivered a fully Arabic RTL interface with bottom-navigation architecture across home, store, cart, and orders sections.

Trip500 — Budget Trip Planner

Compose Multiplatform (CMP), REST APIs, Web

- Built a Compose Multiplatform app for budget-based trip planning with shared UI for Android and iOS.
- Implemented AI-powered itinerary generation and smart budget allocation using real-time travel pricing.
- Developed a companion web app for trip planning and booking redirects, synchronised with the mobile app.

EDUCATION

B.Sc. in Software Engineering

The Hashemite University | Zarqa, Jordan | 2016 - 2020
